

Dynamic filtration in smaller packages

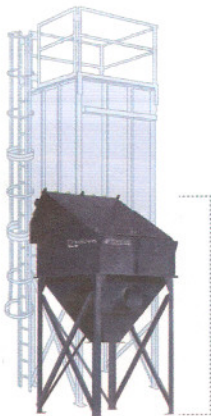

POWER-CORE filter packs deliver better dust filtration by combining Donaldson Torit's proven and patented Ultra-Web® surface-loading technology with a fluted-media design that allows more media in a small volume.

PowerCore filter packs capture both large and small dust particles.

Tests have shown that PowerCore filter packs provide up to 78 percent fewer emissions than traditional bags – translating to cleaner plant air and greater product recovery.

Just seven inches tall, one PowerCore filter pack replaces six traditional eight-foot long fabric filter bags. Dave Blane, Industrial Air Filtration Director, says "The exciting thing about PowerCore is the size of the dust collection units.

Compared to conventional baghouse collectors with similar airflow capacity, PowerCore dust collectors are up to 50% smaller"

Torit PowerCore
50-70% SMALLER
