

Donaldson: The right stuff

In adverse conditions Donaldson, acts to level the playing field. Donaldson products maximise equipment performance and reduce maintenance costs for customers all over the world.

In Africa, where harsh working environments punish trucks and machinery, Donaldson filtration technology supports the construction, mining, agriculture and transport sectors with the world's most advanced filtration products.

Acting as an effective downtime preventative strategy, these leading-edge products filter engine and transmission oil, diesel fuel, hydraulic fluid and coolant, and extend equipment life.

• Donaldson Filtration Systems has launched their new website, giving customers, prospective clients and end users a comprehensive, dynamic and user-friendly site. Users can navigate

COOLANT

Coolant Filters

Coolant filters are designed to maintain the proper chemical balance and reduce contaminants in the engine cooling system.

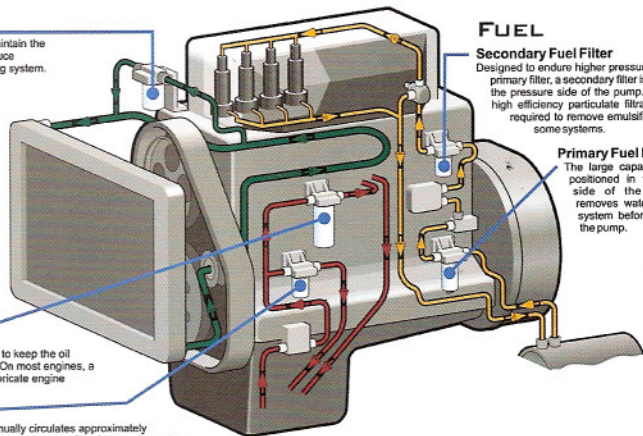

LUBE

Full-flow Filter

Full-flow lube filters are designed to keep the oil clean by removing contaminant. On most engines, a full-flow filter is all you need to lubricate engine components.

By-pass Filter

When used, a by-pass filter continually circulates approximately 10% of the oil in the lubricating system. By-pass filtration supplements the full-flow filter with the capability to remove smaller contaminant.

FUEL

Secondary Fuel Filter

Designed to endure higher pressures than the primary filter, a secondary filter is applied on the pressure side of the pump. It provides high efficiency particulate filtration and is required to remove emulsified water in some systems.

Primary Fuel Filter

The large capacity filter is positioned in the suction side of the pump. It removes water from the system before it gets to the pump.

easily through the company's in-depth product information, catch up with Donaldson's latest news, find their nearest distributor and subscribe to the newsletters.
